

SQL Learning Journal #3

Filtering Data with WHERE

Yildirim Gunes, PhD
Academic Learning Notes
July 21, 2026

Introduction

Today I learned how to filter data in SQL using the WHERE clause. The WHERE clause retrieves only rows that satisfy specified conditions.

Filtering Data

The WHERE clause is used together with the SELECT statement to filter records based on one or more conditions.

SQL Commands Learned Today

- WHERE field_name > 1973
- WHERE field_name = 1973
- WHERE field_name <> 1973
- WHERE field_name >= 1973
- WHERE field_name = 'John'

What I Learned Today

Today I learned how the WHERE clause works together with SELECT to filter table data using comparison operators and text values.
