

SQL Learning Journal #8— SORTING TABLE WITH ORDER BY

1. SQL Commands Learned Today

a. ORDER BY function put the numbers in order from smallest to highest (or from a to z) as default

```
SELECT name, age
```

```
FROM table_name
```

```
ORDER BY age
```

Or we can write the same query below, so we can have more readable query.

```
SELECT name, age
```

```
FROM table_name
```

```
ORDER BY ASC;
```

b. It is possible to order descending the numbers/text

```
SELECT name, age
```

```
FROM table_name,
```

```
ORDER BY age DESC
```

c. When we want to order any text, if there is symbol or number in the text, ORDER BY function take the numbers or symbols before a from the table

```
SELECT name, age
```

```
FROM table_name
```

```
ORDER BY name;
```

d. It is possible to filter before order the information below.

```
SELECT name, age  
FROM table_name  
WHERE age IS NOT NULL  
ORDER BY age DESC;
```

e. The quer below functions as ordering text according to the age, but result table doesn't show the age field.

```
SELECT name  
FROM table_name  
ORDER BY age DESC;
```

If we want to see the field name to provide the clarity on the result table, we should write the query below.

```
SELECT name, age  
FROM table_name  
ORDER BY age DESC;
```

f. ONLY BY function can be used with multiple fields. It provides that if there is two equal value in fieldname1, fieldname2 decides which it will come first.

```
SELECT name, age  
FROM table_name  
ORDER BY fieldname1, fieldname2
```

g. **ONLY BY** can be used with multiple fields with different arguments (some ASC or DESC)

SELECT name, age

FROM table_name

ORDER BY name **ASC**, age **DESC**

Query below will be the same result as above.

SELECT name, age

FROM table_name

ORDER BY name, age **DESC**;

h. **ORDER BY** with other functions

SELECT name, age

FROM table_name

WHERE city='Istanbul'

ORDER BY age **DESC**

LIMIT 10;

2. Learning Notes:

I learned different usage way of ORDER BY function.
