

SQL Learning Journal #13- INNER JOIN

Introduction

Today I learned how to combine related data from two tables using the ****INNER JOIN**** clause. An INNER JOIN returns only the rows that have matching values in both tables.

SQL Commands Learned Today

1. INNER JOIN with ON function

We use the INNER JOIN command to join two tables. INNER JOIN command finds the same field name in both tables.

Table_1:

name	year	age
John	1999	26
Barbro	2001	24
Kristin	1996	29

Table_2:

name	year	city
John	1999	Madrid
Kenneth	2007	Istanbul
Kristin	1996	Köln

SELECT Table_1.name, Table_1.year, age, city

FROM Table_1.

INNER JOIN Table_2

ON Table_1.name=Table_2.name

Result table of query:

name	year	age	city
John	1999	26	Madrid
Kristin	1996	29	Köln

2. INNER JOIN with USING function

USING function can be used instead of ON function for the same function.

```
SELECT Table_1.name, Table_1.year, age, city
```

```
FROM Table_1.
```

```
INNER JOIN Table_2
```

```
USING (name)
```

Result table of query:

name	year	age	city
John	1999	26	Madrid
Kristin	1996	29	Köln

Note: The table.columnname format must be used when we are selecting columns in the tables.

What I Learned Today

Today I learned how to combine data from two related tables using the ****INNER JOIN**** clause. I practiced joining tables with both the ****ON**** and ****USING**** clauses and learned that an INNER JOIN returns only the rows with matching values in both tables.
