

SQL Learning Journal #10– FILTERING GROUPED DATA

Introduction

I learned HAVING function for filtering grouped data.

SQL Commands Learned Today

HAVING

1. HAVING function

```
SELECT year, COUNT (name) AS count_name
```

```
FROM table_name
```

```
GROUPED BY year
```

```
HAVING count_name>20
```

2. Difference between WHERE and HAVING function

-WHERE function filters individual records, HAVING filters grouped data.

-Who born in 2002. We need individual filtering to answer this question.

```
SELECT year, name
```

```
FROM table_name
```

```
WHERE year=2002
```

-In what years was the average age over 25? We need grouped data filtering.

```
SELECT year
```

```
FROM table_name
```

```
GROUPED BY year
```

HAVING AVG (age) >25

What I Learned Today

WHERE and HAVING function a little bit complex issue. But main difference is that individual and grouped data filtering.
