Data Aggregation Functions

Yildirim Gunes, PhD
Academic Learning Notes
July 20, 2026

Introduction

Today I learned SQL aggregation functions, which summarize and analyze data stored in database tables.

Data Aggregation

Aggregation functions perform calculations across multiple rows and return a single summarized result.

SQL Commands Learned Today

- SUM(): Adds numeric values.
- AVG(), MIN(), MAX(), COUNT(): Summary statistics.
- DISTINCT: Returns unique values.
- COUNT(DISTINCT): Counts unique values.
- COUNT(*): Counts all records.

What I Learned Today

Today I learned how to summarize data using SQL aggregation functions including SUM, AVG, MIN, MAX, COUNT, DISTINCT, COUNT(DISTINCT), and COUNT(*).
