

SQL Learning Journal #16- FULL JOINs, crossing into CROSS JOIN

1. FULL JOIN (FULL OUTER JOIN) function

Table_1:

name	year	age
John	1999	26
Barbro	2001	24
Kristin	1996	29

Table_2:

name	year	city
John	1999	Madrid
Kenneth	2007	Istanbul
Kristin	1996	Köln

SELECT t1.name, t1.year, age, city

FROM Table_1 **AS** t1

FULL JOIN Table_2 **AS** t2

USING (name)

Result_Table:

name	year	age	city
John	1999	26	Madrid
Barbro	2001	24	null
Kristin	1996	29	Köln
Kenneth	2007	null	Istanbul

2. CROSS JOIN function

CROSS JOIN function gives us all possible combination of two tables.

Table_1:

name	year
John	1999
Barbro	2001
Kristin	1996

Table_2:

name	city
John	Madrid
Kenneth	Istanbul
Kristin	Köln

```
SELECT t1.name, t2.city  
FROM Table_1 AS t1  
CROSS JOIN Table_2 AS t2
```

Result_Table:

name	city
John	Madrid
John	Istanbul
John	Köln
Barbro	Madrid
Barbro	Istanbul
Barbro	Köln
Kristin	Madrid
Kristin	Istanbul
Kristin	Köln

What I Learned Today

Today I learned how to use ****FULL JOIN**** to combine two tables while preserving all rows from both tables. I also learned how ****CROSS JOIN**** creates every possible combination of rows from two tables. These two JOIN types work differently and are useful for different types of data analysis.
