

SQL Learning Journal #6 – AGGRAGATE FUNCTIONS TO UNDERSTAND DATA

1. SQL Commands Learned Today

We use these functions [**AVG ()**, **SUM ()**, **MIN ()**, **MAX ()**, **COUNT ()**] after SELECT.

a. AVG and SUM can be used only with numerical values.

```
SELECT AVG (field_name)
```

```
FROM table_name
```

```
SELECT SUM (field_name)
```

```
FROM table_name
```

b. MIN, MAX and COUNT functions can be used with various (numerical and non-numerical) values. MIN means A and MAX means Z for non-numerical values.

```
SELECT MIN (field_name)
```

```
FROM table_name
```

```
SELECT MAX (field_name)
```

```
FROM table_name
```

```
SELECT COUNT(field_name)
```

```
FROM table_name
```

c. We can use also alias (new name for result table) with these functions.

```
SELECT MAX (field_name) AS nick_name_max
```

```
FROM table_name
```

d. COMBINING FILTERING WITH SUMMARIZING FUNCTIONS

SELECT AVG (year) **AS** average_year

FROM table_name

WHERE city=İstanbul

SELECT SUM (year) **AS** sum_year

FROM table

WHERE city=İstanbul

e. **ROUND** () function round the decimal. That function has default value which is zero as second argument.

Below two sql gives the same result.

SELECT ROUND (AVG (money)) **AS** average_money

FROM films;

SELECT ROUND (AVG (money), 0) **AS** average_money

FROM films;

f. **ROUND** can be used with positif and negatif values as second argument. Positive number rounds from right sides of the number. Negative number rounds from right sides of the number.

SELECT ROUND (AVG (money), 2) **AS** average_money

FROM films;

SELECT ROUND (AVG (money), -2) **AS** average_money

FROM films;

2. Learning Notes:

It is important to be careful when we write sql. Especially be careful about comma and paranthesis.
