

SQL Learning Journal #15- LEFT-RIGHT JOIN

Introduction

Today I learned to use ****LEFT JOIN**** and ****RIGHT JOIN****

SQL Commands Learned Today

1. LEFT JOIN (LEFT OUTER JOIN) function

Table_1:

name	year	age
John	1999	26
Barbro	2001	24
Kristin	1996	29

Table_2:

name	year	city
John	1999	Madrid
Kenneth	2007	Istanbul
Kristin	1996	Köln

SELECT t1.name, t1.year, age, city

FROM Table_1 **AS** t1

LEFT JOIN Table_2 **AS** t2

USING (name)

Result_Table:

name	year	age	city
John	1999	26	Madrid
Barbro	2001	24	null

Kristin	1996	29	Köln
---------	------	----	------

2. RIGHT JOIN (RIGHT OUTER JOIN) function

Table_1:

name	year	age
John	1999	26
Barbro	2001	24
Kristin	1996	29

Table_2:

name	year	city
John	1999	Madrid
Kenneth	2007	Istanbul
Kristin	1996	Köln

SELECT t1.name, t1.year, age, city

FROM Table_1 **AS** t1

RIGHT JOIN Table_2 **AS** t2

USING (name)

Result_Table:

name	year	age	city
John	1999	26	Madrid
Kenneth	2007	null	Istanbul
Kristin	1996	29	Köln

What I Learned Today

Today I learned how to use ****LEFT JOIN**** and ****RIGHT JOIN**** to combine related tables. I also learned that these joins can preserve unmatched records and represent missing

information with `NULL`. Understanding which table's records should be preserved is important when choosing between different types of joins.
