

SQL Learning Journal #5 – COMBINING FILTERING, SELECTING AND MISSING VALUES

1. SQL Commands Learned Today

a. Question:

We want to count the number of unique names (people) in a list, at the same time these names (people) are between 10-19 years old also they can speak only French language.

```
SELECT COUNT (DISTINCT people_names) AS unique_people_name  
FROM people_name_table  
WHERE age BETWEEN 10 AND 19  
AND language='French'
```

b. Missing Values:

COUNT (*) that command count all the values including missing values (null) [count all rows]

COUNT (field_name) that command counts the number of only non-NULL values in the specified column. [excluding null values]

COUNT (DISTINCT field_name) that command count unique non-null values.

c. IS NULL and IS NOT NULL commands:

```
SELECT COUNT (*) AS count_no_age  
FROM table_name  
WHERE field_name_age IS NULL
```

SELECT COUNT (field_name) AS count_age
FROM table_name
WHERE field_name_age **IS NOT NULL**

COUNT () command	IS NOT NULL
SELECT COUNT (age) AS count_age	SELECT COUNT (age) AS count_age
FROM films	FROM films
	WHERE age IS NOT NULL
NOTES: These two command functions as the same way. The results are the same.	

2. Learning Notes:

When we start to combine the sql commands, It is difficult to remember all the commands. So that I have to do more practice.
