

SQL Learning Journal #2 – DATA AGGREGATION

1. SQL Commands Learned Today

a. Command SUM: It added all values in the columns

```
SELECT SUM(field_name)
```

```
FROM table_name;
```

b.

```
SELECT SUM(field_name) AS total_revenue
```

```
FROM order;
```

Note: Command AS only affects the name in the result set not in the database.

c. Command AVG, MIN, MAX, COUNT: that commands find the average, minimum, maximum value of column. COUNT also counts the number of rows/values.

```
SELECT MIN (table_name) AS minimum_value, MAX(table_name) AS maximum_value,  
AVG(table_name)
```

```
FROM orders;
```

```
SELECT COUNT(table_name) AS count_of_table
```

```
FROM table_name
```

d. SELECT DISTINCT (table_name): we can find the numbers of unique values.

```
SELECT DISTINCT(table_name) AS unique_value
```

```
FROM table_name;
```

e. See below command to find the count of unique values:

```
SELECT COUNT (DISTINCT table_name)
```

```
FROM table_name;
```

f. to find total number of records in the table.

```
SELECT COUNT(*) AS total_record
```

2. Learning Notes:

We can take more information with aggregation function from table.
